EDUCATION

University of Washington

Ph.D. in Economics

Seattle, USA

2020 – Present

University of Washington

M.A in Economics

Seattle, USA

2022

Kyung Hee University

B.A in Economics

Seoul, Korea

2019

RESEARCH INTERESTS

Macroeconomics, Urban Economics, Spatial Economics, Labor Economics, Housing Market

TEACHING

Instructor of Record, Central Washington University

ECON 325 Introduction to Forecasting

Sammamish, US

Spring 25

Teaching Assistant, University of Washington

ECON 509 Macroeconomic Analysis III

Seattle, US

Spring 24

- Course evaluation: 4.9/5

Teaching Assistant, University of Washington

ECON 503 Macroeconomic Analysis II

Seattle, US

Winter 24

- Course evaluation: 4.8/5

Teaching Assistant, University of Washington

ECON 200 Introduction to Microeconomics

Seattle, US

Fall 22, Fall 23, Fall 24

- Course evaluation: 3.9/5

Instructor of Record, University of Washington

ECON 301 Intermediate Macroeconomics

Seattle, US

Spring 23

- Course evaluation: 3.1/5

Instructor of Record, University of Washington

ECON 300 Intermediate Microeconomics

Seattle, US

Fall 21, Spring 22, Winter 23

- Course evaluation: 3.6/5

Teaching Assistant, University of Washington

ECON 201 Introduction to Macroeconomics

Seattle, US

Winter 22

- Course evaluation: 4.0/5

Reader/Grader

Reader/Grader for ECON 412

Macroeconomics and Inequality

Seattle, US

Winter 24, Spring 24, Spring 25, Winter 26

Reader/Grader for ECON 483

Econometric Applications

Seattle, US

Winter 23, Fall 24, Fall 25, Winter 26, Spring 26

Works in Progress

- **Option Value of Internal Migration: A Quantitative Spatial Approach**

I study the value of migration in a spatial equilibrium model with heterogeneous households in wealth, age, productivity, and tenure. Migration value does not align with migration rates: younger and lower-wealth households move more, but higher-wealth households obtain larger gains, while the aggregate migration value of renters and homeowners is not substantially different. I show that these differences arise from distinct migration motives. Lower-wealth households move to high-income, high-price regions at younger ages (investment motive) and to lower-cost regions at older ages to manage income risk (insurance motive). In contrast, higher-wealth households move toward lower housing price locations to increase housing service consumption. I further show that across different environments, overall welfare gains and the value of migration opportunities are distributed differently across wealth groups.

- **Education, Mobility, and Welfare in a Core–Periphery Economy (with Kisan Choi)**

We develop a dynamic quantitative spatial model with a dual labor market structure to study regional mobility and distributional effect in Korea. The economy consists of a productive core and less productive peripheral regions that differ in labor market conditions and living costs. Although wage gap is modest, the core offers a stronger career ladder, with higher transitions from secondary to regular jobs, which drives young individuals from peripheral regions to migrate to the core. When local education investment increases, only young households' human capital rises in the short run, intensifying brain drain to the core. This raises living costs in the core and pushes lower-wealth households toward peripheral regions, generating welfare gains for movers and losses for displaced low-wealth households, and widening regional disparities. In the long run, however, human capital rises for all generations in peripheral regions. This strength local productivity through agglomeration effects and improving career ladders. This attracts households back to the periphery, raises local welfare, and reduces regional inequality.

- **Housing Price Shocks and Wealth Inequality: The Role of Entrepreneurship (with Kisan Choi and Jinseok Park)**

We study how housing price shocks affect wealth inequality through entrepreneurial entry. Rising housing prices allow high-wealth homeowners to finance entrepreneurship through capital gains, while falling prices lower entry costs for lower-wealth households. We show that these opposing channels shape the distribution of entrepreneurial opportunities and amplify or reduce wealth inequality depending on the direction of housing price changes.
